Pleotint Reaches Milestone, Completes 100th Project

JENISON, Mich., June 24, 2014 – Pleotint, LLC, announced the completion of the 100th project featuring *Suntuitive* glass, the first commercially available self-tinting glass for window applications.

Curtis Liposcak, President of Pleotint, said the development represents an exciting and cherished milestone for his company. “We introduced *Suntuitive* glass in 2011 as the first-of-its-kind dynamic glass technology, and here we are just three years later celebrating our 100th install,” he added.

Suntuitive glass has been specified for a variety of projects across the country, ranging from single-family homes and education facilities to retail stores and commercial buildings.

“What’s unique about *Suntuitive* glass is that it offers the same solar control benefits and energy-efficiency improvements as other dynamic glass technologies, but without the complicated installation, wires, and wall controls,” he said. “The self-tinting glass also enhances design freedom, because it can be utilized in operable and non-operable windows of all shapes and sizes, as well as doors.”

Suntuitive glass provides a light-gray base color that offers unrivaled color neutrality and compatibility with glass tints. Because of its ability to passively adapt to direct sunlight, the self-tinting technology optimizes indoor comfort, views and daylighting, while blocking heat generated from sunlight, glare, and ultraviolet light without obtrusive window shades or blinds.

When paired with low-emissivity glass in an insulating glass unit, *Suntuitive* glass can produce visible light transmittance of as high as 60 percent in a clear state, solar heat gain coefficients of as low as 0.11 in a darkened state, and reduce heating-, cooling-, and lighting-related energy costs, which together add up to 70 percent of a building’s total energy consumption.
